AADK Task 2 Report

Understanding Android Studio and App Structure

Name: Guru K R

Course Title: Android App Development: First Steps

Date: February 16, 2026

Contents

1 Navigating Android Studio 2

2 Exploring Project Structure 2

3 File Mapping Diagram 3

4 Mini Reflection 4

Navigating Android Studio

1.1 Android Studio Interface Screenshot

Labeled Sections:

- **Project Panel** – Displays project files, folders, and resources.
- **Code Editor** – Area where Kotlin or Jetpack Compose code is written.
- **Preview Area** – Shows a visual representation of UI components.

Exploring Project Structure

2.1 Key Project Files

- MainActivity.kt
- AndroidManifest.xml
- res/values/strings.xml
- build.gradle (Module)

2.2 File Purpose Table

File Name	Purpose
MainActivity.kt	The main entry point of the application where app logic and UI setup begin.
AndroidManifest.xml	Contains essential app information such as permissions, activities, and app configuration.
res/values/strings.xml	Stores text strings used in the app to support easy updates and localization.
build.gradle (Module)	Defines dependencies, SDK versions, and build configuration for the app.

File Mapping Diagram

Project Structure Flow Diagram

Example Flow Explanation:

AndroidManifest.xml registers MainActivity → MainActivity loads UI resources → Resources (strings.xml) provide text content → build.gradle manages dependencies and project configuration.

Mini Reflection

Reflection

Through this task, I learned how Android Studio organizes files in a structured and logical way. Each file has a specific responsibility, from defining app configuration to managing UI resources and dependencies. Understanding this structure before coding helps developers avoid confusion and build scalable applications. It also improves debugging and collaboration, as team members can quickly locate and modify the required components.
